

Bob 360

The AI Tech Lead that never sleeps.

From the first line of code, to the 3 AM crash — we've got your repo covered.

Powered by IBM Bob.

The Problem

Every software team bleeds time.

-  Hours lost hunting cascade bugs from 1 renamed variable
-  Dead code bloating repositories by 50%+
-  Non-technical executives who don't understand what shipped
-  Someone getting woken up at 3 AM when production crashes

These aren't edge cases. They happen every single week.

Enter Bob 360

We built an AI guardian with 4 core modules that watches the entire SDLC.

-  **Domino Preventer**: Stops cascade failures BEFORE they happen.
-  **Code Diet**: Finds & removes dead code safely.
-  **PR Translator**: Converts technical PRs to executive business language.
-  **3AM Savior**: Traces crash logs to the exact root cause in seconds.

The Secret Sauce

Why is this only possible with IBM Bob?

Standard AI tools only see a single *code snippet*. They act like glorified autocompletes.

IBM Bob sees the ENTIRE repository. It understands your architecture, file dependencies, import chains, and git history.

Full-repo context isn't a feature for us — it's the foundation of Bob 360.

Real Impact

What we achieved in this demo:

-  **1 cascade failure blocked:** 4 files saved from breaking.
-  **54% repo size reduction:** Safely removed 5 files and 4 zombie packages.
-  **Executive report:** Generated in 3 seconds (saves 30+ minutes manually).
-  **Downtime resolved:** 43 seconds instead of 40+ minutes of manual debugging.

Built by the next generation of builders.

Huseyn Verdiyev & Farid Hashimli

We are two high school students from Azerbaijan, but we build like seasoned Silicon Valley engineers. While others are playing games, we are architecting solutions for real-world enterprise problems.

We don't just write code; we envision the future of software development. Bob 360 is our first step toward building the ultimate AI developer ecosystem.

We are the young disruptors. And we are just getting started.
